

Pro-fit University Application Demo Video Memo

Version: 2026-10-03 | Recommended length: 5-6 minutes | Use: recording guide for a university application video

Purpose

Give the reviewer a clear, honest view of the product, the student-athlete problem it addresses, and the engineering decisions behind it.

What the video should communicate

Pro-fit is a training workspace for student athletes and coaches. It connects a coach-assigned plan with the student's real day: available time, school workload, energy, training logs, meals, check-ins, and coach feedback.

- A student athlete has a training plan but also has school and changing energy levels.
- The athlete follows the plan, records what happened, and uses My Day to make the plan fit.
- The coach reviews the information and uses it to plan the next action.

Recording setup

- Use a clean browser window at 1440x900 or 1920x1080.
- Record the local app at <http://127.0.0.1:5173/> after the server has loaded.
- Use the existing Michael (Coachee) and Coach Ben (Coach) demo accounts. Pre-login, and never show email addresses, passwords, tokens, or private account details.
- Keep browser zoom at 90-100% and enable cursor highlighting. Record clear voice and add English captions if the portal allows them.
- Use the current cloud-backed demo when available. If recording in local mode, describe it as a local demonstration and do not present browser-only data as production evidence.

Before pressing Record

- Open the landing page and confirm the correct role name is visible after login.
- Let the first-login guide appear. It can be advanced with Next, dismissed with Skip guide, and reopened through How it works.
- Confirm Michael can open Today's Training, Weekly Plan, Training History, and My Day.
- Confirm My Day shows Time available, School workload, Energy right now, and Save daily priorities.
- Use existing demo records for coach review. Do not submit Michael's real check-in or create personal records during the recording unless the demo workspace has been reset.
- Close unrelated tabs and notifications. Hide bookmarks and personal browser information.

Recommended recording sequence

Time	Screen action	Suggested narration	Evidence to show
0:00-0:30	Start with the Pro-fit title or landing page.	I built Pro-fit to help student athletes connect training with the reality of school, recovery, and daily time constraints.	Product name and the student-athlete problem.
0:30-1:00	Briefly introduce the two roles.	A coach creates and reviews the plan. A student sees a clear next step, records what actually happened, and communicates back.	Role-based workspace idea.
1:00-1:20	Log in as Michael and show the page guide. Advance one or two steps, then choose Skip guide.	The first-login guide explains what each page does. It can be skipped and reopened later from How it works.	Contextual guide, Next/Skip behavior, accessible help.
1:20-2:00	On Today's Training, show the workout, one Exercise Guide, the nutrition plan, and the check-in area.	Michael starts with today's coach-assigned plan. The page shows the session, movement guidance, meal ideas, and the place to send a daily check-in.	Training details, exercise guidance, nutrition, check-in workflow.
2:00-2:45	Open My Day. Change the selectors to 30 minutes, a typical school day, and low energy. Click Save daily priorities.	My Day lets the student describe the day before training. Pro-fit suggests a manageable approach without replacing the coach's assigned plan.	Time, school workload, energy, saved priorities, suggested approach.
2:45-3:15	Show Training History or recent check-ins on My Day.	The student can return to recent check-ins and coach feedback, so progress is a conversation rather than a single completion checkbox.	History and feedback context.
3:15-4:20	Log out and log in as Coach Ben. Show Coachees, the roster, and one existing review.	The coach sees the assigned athletes and can review the information that came back from training. This supports a more specific next decision.	Roster, plan status, check-in review, feedback.
4:20-4:50	Open Workouts or Assign Plan and briefly show editable plan fields. Do not publish changes during the recording.	The coach can shape a plan with dates, duration, exercises, sets, reps, rest, and instructions, then publish it when it is ready.	Coach-side planning workflow.
4:50-5:30	End on My Day or the coach roster.	I built this as a working React and Supabase application. The project taught me to turn a real student-athlete problem into role-based workflows, data rules, and a product that can be tested locally and with two accounts.	Personal ownership, implementation, and learning.

Short closing script

Pro-fit is designed to help student athletes train consistently while staying honest about school, energy, and recovery. The coach creates the plan, the student follows and records it, and the next decision is based on the student's actual day. I built this project to make that communication clearer and more practical.

Accurate feature boundaries

- My Day daily priorities are connected to the cloud database in the current demo. Save, account isolation, and read-only behavior after check-in submission have been tested against the project database.
- Sleep tracking is still shown as not connected in the cloud workspace. Do not say that cloud sleep data is already fully persisted. Describe sleep and recovery as planned or locally demonstrated capabilities.
- Do not claim university pilot results, injury reduction, medical outcomes, or measured user impact unless those results have actually been collected and documented.
- Present training suggestions as planning support. They are not medical advice or a universal training prescription.
- Use demo identities and fictional or sample records only. Do not show real student health information, photos, email addresses, or passwords.

Submission package

- Recommended video filename: Michael_Pro-fit_University_Demo_2026.mp4
- Recommended memo filename: Pro-fit_University_Demo_Video_Memo.pdf
- Before uploading, check that the first 10 seconds identify the project, the audio is understandable, the cursor does not cover controls, and the file opens without access to the local development server.

Three-minute cut

- 20 seconds: problem and purpose.
- 45 seconds: Michael's Today's Training page.
- 45 seconds: My Day with the three selectors and Save daily priorities.
- 45 seconds: Coach Ben's roster and review.
- 25 seconds: technical learning and closing statement.
